Getting Started with Azure Kubernetes Service

Srikant Sarwa

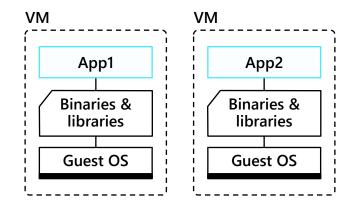

Senior Customer Engineer

Microsoft Azure – FastTrack for Azure

Agenda

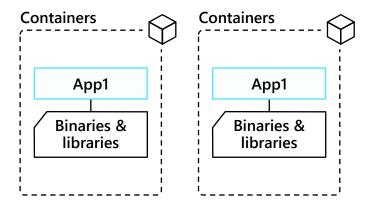

- Containers getting started
- Kubernetes Architecture and basic terminology
- AKS Azure's managed service offering
- Best practices with Operational Guidance

What is a container

Virtual machines

Virtualize the hardware VMs as units of scaling

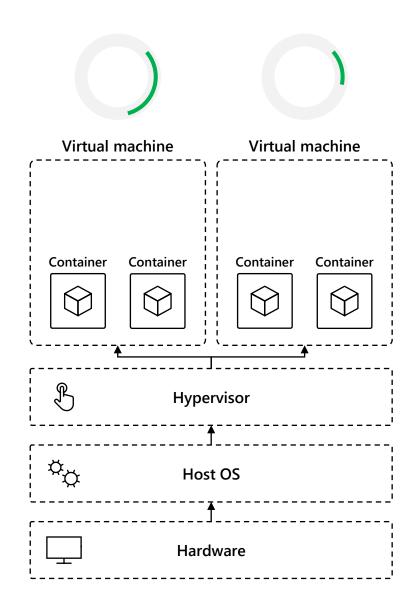

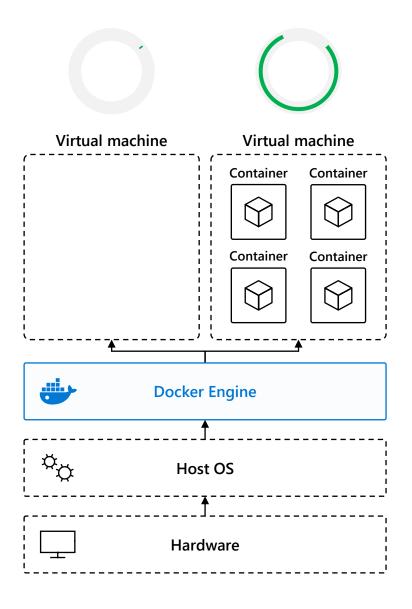

Containers

Virtualize the operating system

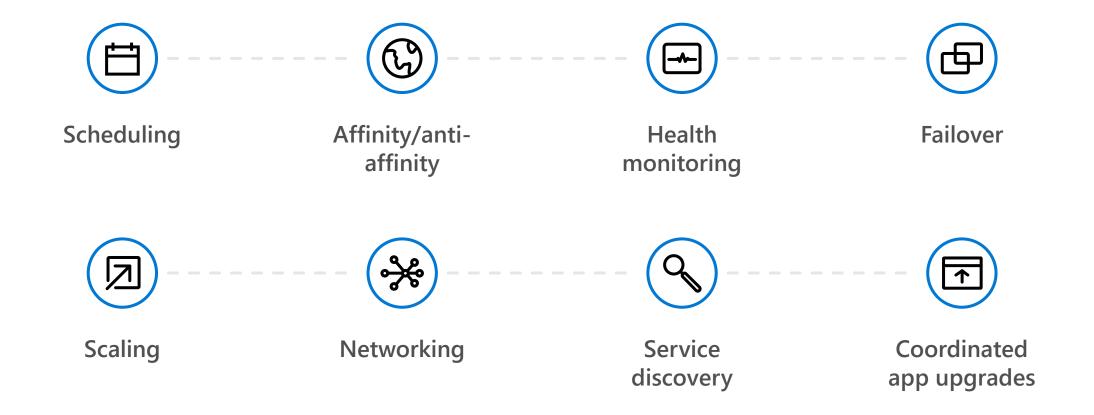

Applications as units of scaling

Traditional vs Modern approach on Containers

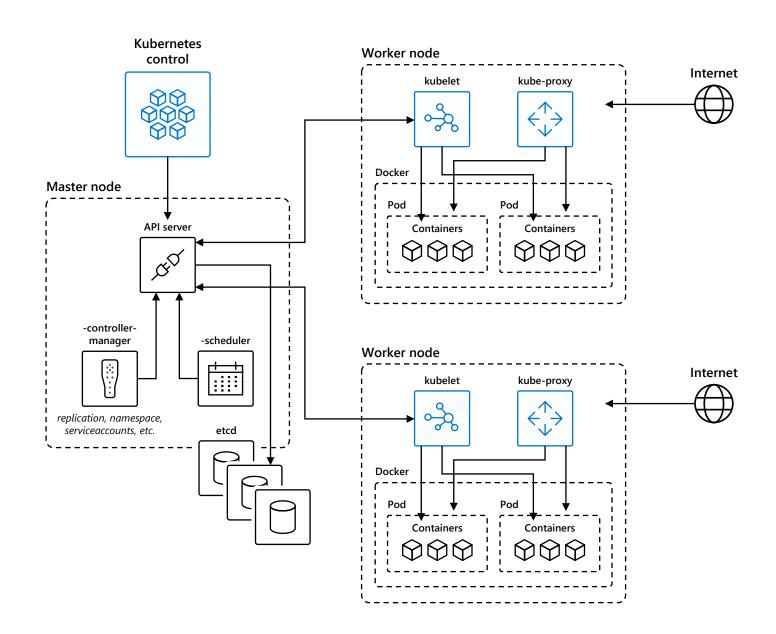

The elements of orchestration

Kubernetes Architecture

- Kubernetes users communicate with API server and apply desired state
- 2. Master nodes actively enforce desired state on worker nodes
- 3. Worker nodes support communication between containers
- 4. Worker nodes support communication from the Internet

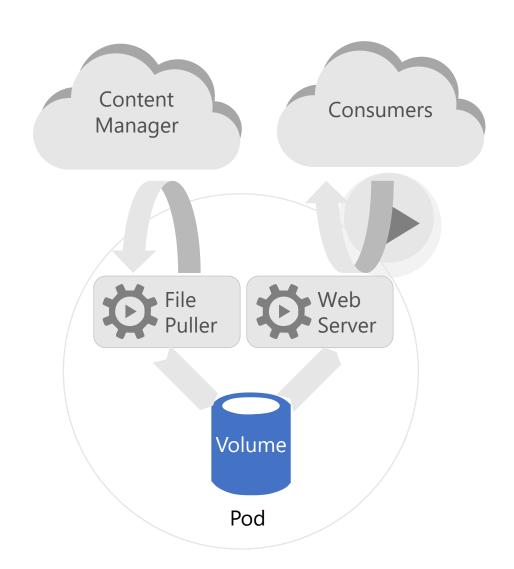

Kubernetes Resources

pod	deployment	ReplicaSet
service	namespace	volumes
config-map	secret	ingress
StatefulSet	DaemonSet	jobs

What is a pod?

- Pod is the basic building block in Kubernetes
- Pods are how containers are delivered
- Can be multiple containers (e.g. side car)
- Encapsulates container(s), storage, network IP, and options on how to run

Kubernetes manifest: Pod

```
apiVersion: v1
kind: Pod
metadata:
  name: azure-vote
  labels:
    app: web
spec:
  containers:
    - name: azure-vote-front
      image: microsoft/azure-vote-front:v1
      ports:
        - containerPort: 80
    - name: azure-vote-back
      image: redis
      ports:
        - containerPort: 6379
```

pod name: azure-vote Container Container azure-vote-front azure-vote-back Port 80 Port 6379 Image: Image: redis microsoft/azurevote-front:v1

What is a deployment?

Deployment provides declarative updates for Pods and ReplicaSets.

- Create deployment to rollout ReplicaSet
- Declare new state for pods (eg new imageTag)
- Rollback to earlier revision
- Scale up or down
- Check rollout history
- Clean-up older ReplicaSets

Kubernetes manifest: Deployment

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: azure-vote-back
spec:
  replicas: 4
  template:
    metadata:
      labels:
        app: azure-vote-back
    spec:
      containers:
      - name: azure-vote-back
        image: redis
        ports:
        - containerPort: 6379
```

pod name: azure-voteback-xyz1

Container

azure-vote-back Port 6379

Image: redis labels: azure-vote-back

pod name: azure-voteback-xyz2

Container

azure-vote-back Port 6379

Image: redis labels: azure-vote-back

pod name: azure-voteback-xyz3

Container

azure-vote-back Port 6379

Image: redis labels: azure-vote-back

pod name: azure-voteback-xyz4

Container

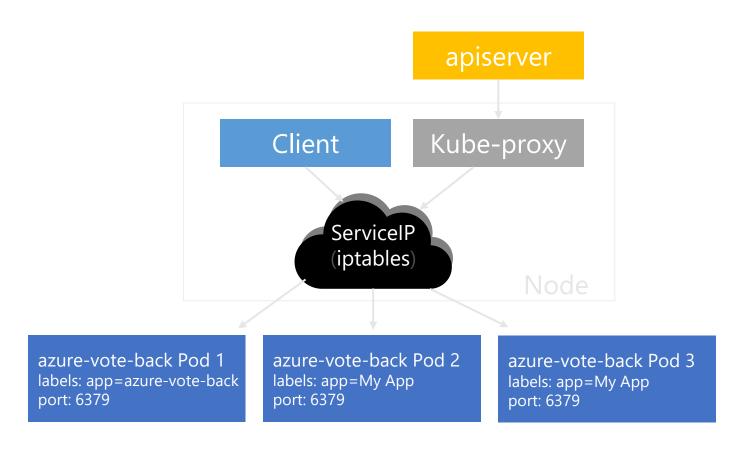

azure-vote-back Port 6379

Image: redis labels: azure-vote-back

What is a service?

Essentially a load balancer in front of pods

- Defines a logical set of pods
- Identified/selected using Labels

Kubernetes manifest: Service

```
apiVersion: v1
kind: Service
metadata:
  name: azure-vote-back
spec:
  ports:
  - port: 6379
  selector:
    app: azure-vote-back
```

Service name: azure-vote-back

Port 6379 selector: app=azure-vote-back

pod name: azure-voteback-xyz1

Container

azure-vote-back Port 6379

Image: redis
labels: app=azure-voteback

pod name: azure-voteback-xyz2

Container

azure-vote-back Port 6379

Image: redis labels: app=azure-voteback

Namespaces

- multiple virtual clusters backed by the same physical cluster
- logical separation/isolation
- Every resource type is scoped to a namespace (except for nodes, persistentVolumes, etc.)
- Intended for environments with many users, teams, projects
- Kube-system namespace for dashboard etc.

root@srikantsarwa:~# kubectl get namespaces

• NAME STATUS AGE

• default Active 3h1m

kube-node-lease Active 3h1m

• kube-public Active 3h1m

kube-system Active 3h1m

Bring it all together

Internet

Service

name: azure-vote-back

Port 6379 selector: app=azure-vote-back

Service name: azure-vote-front

Port 80 selector: app=azure-vote-front

pod name: azure-voteback-xyz1

Container

azure-vote-back Port 6379

Image: redis labels: azure-vote-back

pod name: azure-voteback-xyz2

Container

azure-vote-back Port 6379

Image: redis labels: azure-vote-back

pod name: azure-votefront-xyz1

Container

azure-vote-front Port 80

Image: azure-votefront:v1 labels: azure-vote-front pod name: azure-votefront-xyz2

Container

azure-vote-front Port 80

Image: azure-votefront:v1 labels: azure-vote-front

Kubernetes Benefits

containers.

Scaling Storage and application management of container count sensitive up or down information dynamically such as Management of Deployment of based on usernames and demand. containers. passwords. storage. Self-healing of Automation of Management of

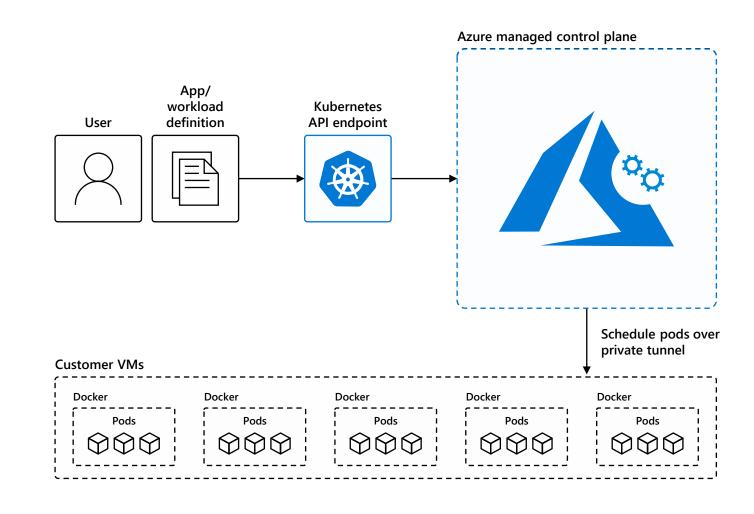

rolling updates

and rollbacks of containers.

network traffic.

Managed Kubernetes on Azure

- Automated upgrades, patches
- High reliability, availability
- Easy, secure cluster scaling
- Self-healing
- API server monitoring
- At no charge

Best Practices for AKS

Networking configuration

- Network topology
- Plan the IP addresses
- Deploy Ingress resources

Cluster compute

- Compute for the base cluster
- Container image reference
- Policy management

Identity management

- Integrate Azure AD for the cluster
- Integrate Azure AD for the workload

Secure data flow

- Secure the network flow
- Add secret management

Business continuity

- Scalability
- Cluster and node availability
- Availability and multi-region support

Operations

- Cluster and workload CI/CD pipelines
- Cluster health and metrics
- Cost management and reporting

Baseline AKS Cluster setup

Use Hub and Spoke Architecture for Networking design

- Hub VNET Azure Firewall, Gateway, Bastion
- Spoke VNET Application Gateway, Cluster Nodes

Container Image Reference

Make use of Azure Container
Registry, AKS provides addon to
attach the ACR

Pull images from authorized registries

Associate Kubernetes RBAC with Azure AD

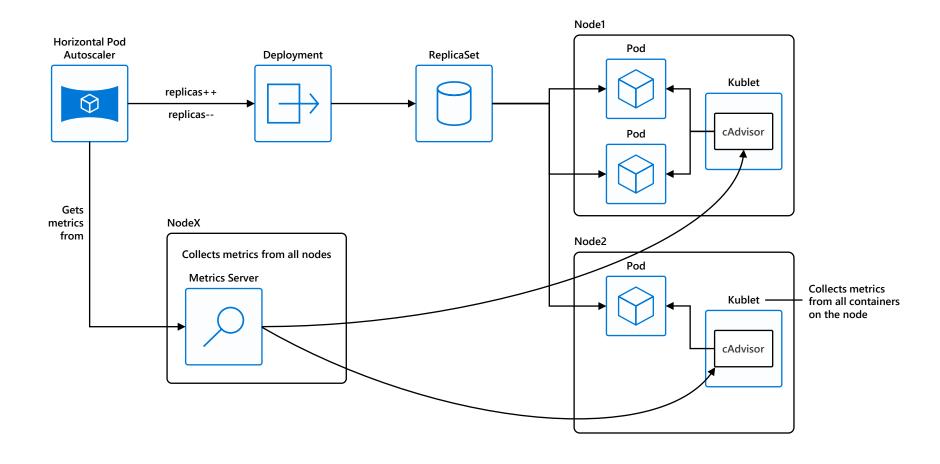

Deploy Ingress Resource
Nginx, AGIC

Deploy WAF

Use Azure Policy integrated with AKS

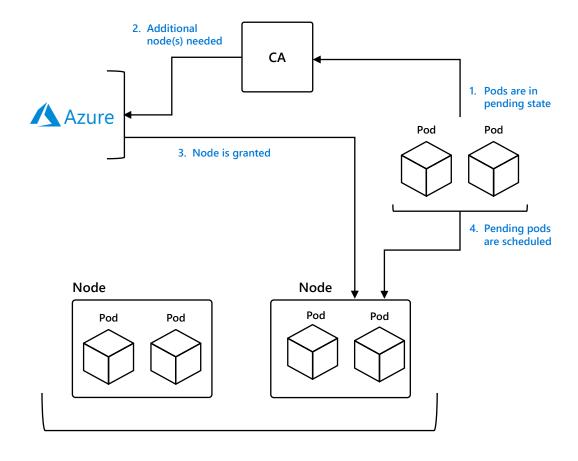

Node and pod scalability
Horizontal Pod Autoscaler
Cluster Autoscaler

Horizontal Pod Autoscaler

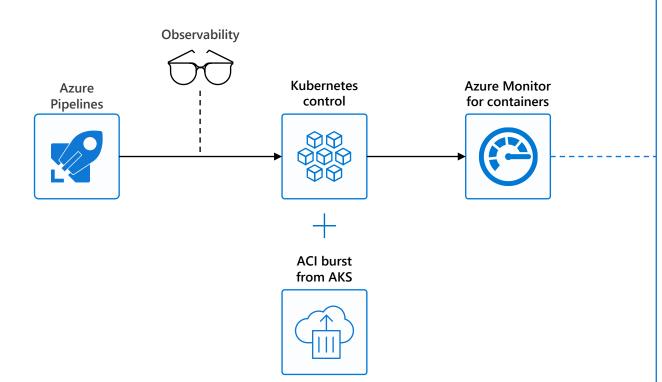

Cluster Autoscaler

- Scales nodes based on pending pods
- Scale up and scale down
- Reduces dependency on monitoring
- Removes need for users to manage nodes and monitor service usage manually

AKS Cluster

Azure Monitor for containers

Visualization

Visualize overall health and performance from clusters to containers with drill downs and filters

Insights

Provide insights with multi-cluster health roll up view

Monitor & Analyze

Monitor and analyze Kubernetes and container deployment performance, events, health, and logs

Response

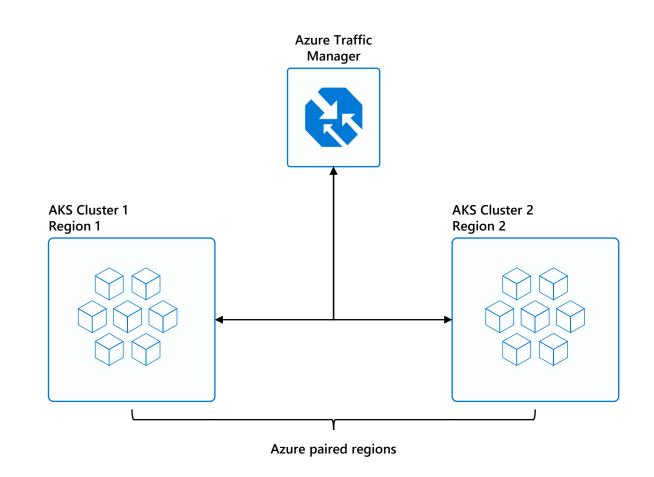

Native alerting with integration to issue managements and ITSM tools

Observability

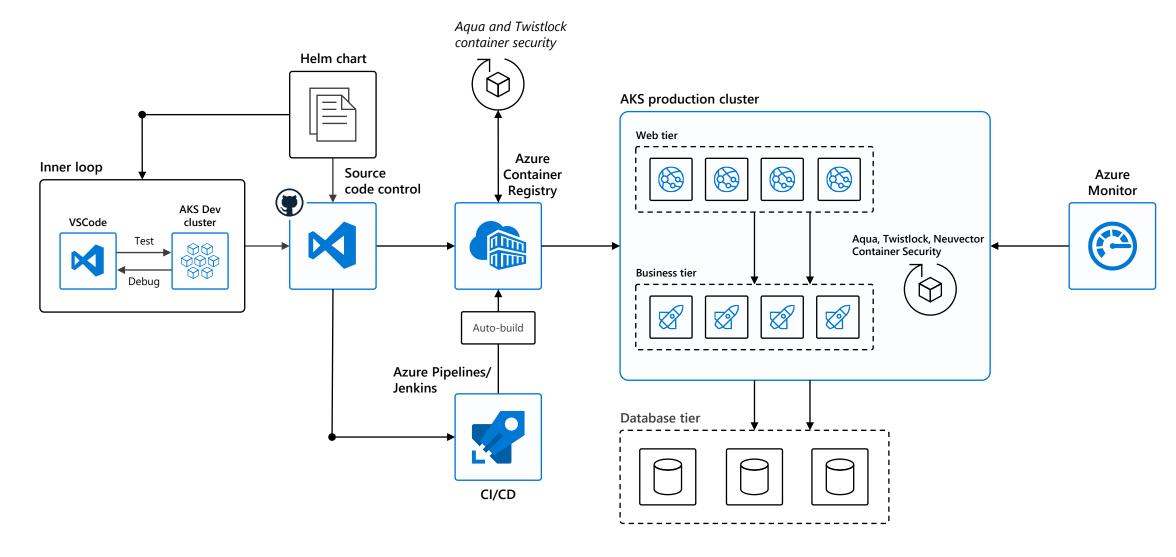

Observe live container logs on container deployment status

Multi-Region Clusters

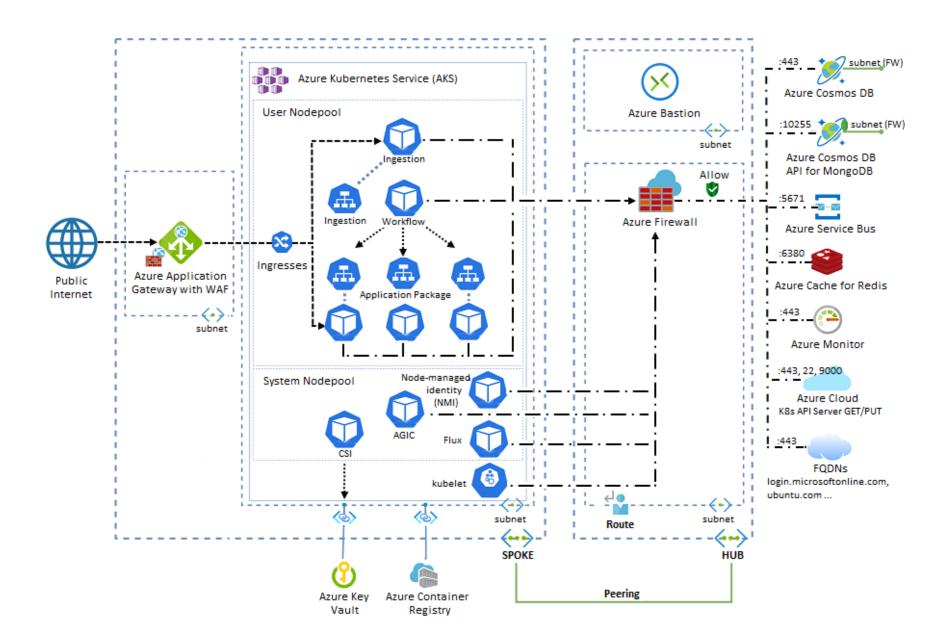

- Minimize downtime risk
- One live region
 - Another backup
 - Or weighted traffic
- A/B testing

DevOps

Production AKS Cluster workload Architecture

Containers in Azure

Service Fabric

Kubernetes Service

Container Instance

App Service

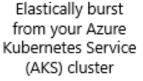

Deploy web apps or APIs using containers in a PaaS environment Modernize .NET applications to microservices using Windows Server containers

Run code ondemand without having to explicitly provision or manage infrastructure Scale and orchestrate Linux containers using Kubernetes

Run large-scale parallel and highperformance computing (HPC) applications efficiently in the cloud

Ecosystem

Bring your Partner solutions that run great on Azure

IoT Edge

Move cloud analytics and custom business logic to devices

Azure Container Registry

Docker Hub

Demo!!!
